Your pet will be undergoing general anesthesia today. Advances in anesthesia have made routine procedures relatively safe, with low rates of complications. However, occasional problems can occur due to pre-existing conditions not made evident during routine histories and physical examinations. In order to recognize any underlying abnormalities your pet may have, we will do a pre-surgical blood profile on your animal. This consists of a check on sodium, potassium, chloride, glucose, hemoglobin, hematocrit and BUN (kidney perfusion).

These blood tests will help us to assess the health status of your pet more completely and determine if there are any additional precautions we need to take before surgery.

There is an additional charge for these blood tests. We hope you understand the need for these important tests. Our concern is for the safety of your animal during this anesthetic procedure.
